### **12.1 Supplemental Antioxidant Nutrients: Combined Vitamins and Trace Elements**

There are no new randomized controlled trials since the 2015 updates and hence there are no changes to the following summary of evidence.

# Question: Does the addition of Supplemental Combined Vitamins and Trace Elements result in improved outcomes in the critically ill patient?

**Summary of evidence:** Of the 28 studies included, there were eight level 1 and twenty level 2 studies reviewed that compared various antioxidants either as single nutrients (zinc, selenium) or as a combination of nutrients (selenium, copper, zinc, vit. A, C & E, N-acetylcysteine) given by various routes (IV/parenteral, enteral, combined parenteral and enteral). One study was published in 2 parts (Berger et al, Intensive Care Medicine 2001;27:91-100 and Berger et al, Nutrition Research;21:41-54) and the data listed here represent the data from the latter study (intent to treat). This study had two intervention arms (selenium alone and selenium combined with zinc and  $\alpha$  tocopherol compared to placebo) and the data presented here are for the combined group only. Refer to topic 11.2 Parenteral Selenium (alone or in combination) for the results of both groups combined and subgroup analyses including the monotherapy group only. Howe 2015 also had two intervention arms (Vit C+E and Vit C+E+N-acetylcysteine) and the data for the two intervention arms has been combined in this meta-analysis.

**Mortality:** Twenty-five studies reported on mortality and when the results were aggregated, antioxidant supplementation was associated with a significant reduction in overall mortality (RR 0.88, 95% CI 0.78, 1.00, p=0.04, heterogeneity I<sup>2</sup>=24%; figure 1). Linder (2004) and Nogueira (2013) were excluded from the meta-analyses because the type of mortality was not specified but appeared to be 90 days and mortality was only reported as a percent of total deaths, respectively. The following subgroup analyses were completed:

Antioxidant delivery method: When the 17 studies which delivered antioxidants intravenously were sub-grouped and analysed, antioxidant supplementation was not associated with a reduction in overall mortality (RR 0.93, 95% CI 0.83, 1.04, p=0.22, heterogeneity  $l^2=1\%$ ; figure 1). When the 5 studies which delivered antioxidants via enteral nutrition were sub-grouped and analysed, antioxidant supplementation was associated with a significant reduction in overall mortality (RR 0.69, 95% CI 0.56, 0.85, p=0.0005, heterogeneity  $l^2=0\%$ ; figure 1). When the data from the subgroup comprised of the 3 studies which delivered antioxidants enterally and intravenously were aggregated, antioxidant supplementation had no effect on overall mortality (RR 1.07, 95% CI 0.92, 1.25, p=0.38, heterogeneity  $l^2=0\%$ ; figure 1). The test for subgroup differences was significant (p=0.004).

**Mortality (higher vs. lower mortality in control group):** Subgroup analysis showed that antioxidant supplementation was associated with a significant reduction in overall mortality among patients with higher risk of death (>10% mortality in the control group) (RR 0.86, 95% CI 0.75, 0.99, p=0.03, heterogeneity I<sup>2</sup>=39%; figure 2). There was no significant effect observed for trials of patients with a lower mortality in the control group (RR 1.10, 95% CI 0.68, 1.77, p=0.70, heterogeneity I<sup>2</sup>=0%; figure 2). The test for subgroup differences was not significant (p=0.34).

**Infections:** When the 12 studies that reported on the number of patients with infectious complications were aggregated, antioxidant supplementation was associated with a trend towards reduction in overall infections (RR 0.94, 95% CI 0.88, 1.02, p=0.14, heterogeneity I<sup>2</sup>=0%; figure 3). The following subgroup analyses were completed:

**Antioxidant delivery method:** When a subgroup analysis based on 6 studies which delivered antioxidants intravenously was done, antioxidant supplementation was not associated with a reduction in infectious complications (RR 0.96, 95% CI 0.88, 1.04, p=0.35, heterogeneity I<sup>2</sup>=0%; figure 3). When a subgroup analysis based on 3 studies which delivered antioxidants via enteral nutrition was done, antioxidant supplementation had no effect on infectious complications (RR 1.10, 95% CI 0.60, 2.04, p=0.75, heterogeneity I<sup>2</sup>=38%; figure 3). When a third subgroup analysis based on 3 studies which delivered antioxidants enterally and intravenously was done, antioxidant supplementation was associated with a trend towards a reduction in infectious complications (RR 0.90, 95% CI 0.77, 1.05, p=0.19, heterogeneity I<sup>2</sup>=0%; figure 3). The test for subgroup differences was not significant (p=0.71).

**Infections (higher vs. lower mortality in control group):** Subgroup analysis showed that antioxidant supplementation was associated with a trend in a reduction in infectious complications among patients with higher risk of death (>10% mortality in the control group) (RR 0.95, 95% CI 0.88, 1.03, p=0.20, heterogeneity I<sup>2</sup>=0%; figure 4). There was no significant effect observed for patients in trials with a lower mortality in the control group (RR 0.86, 95% CI 0.68, 1.10, p=0.22, heterogeneity I<sup>2</sup>=0%; figure 4). The Maderazo study was not included in the analysis since it does not report on mortality. The test for subgroup differences was not significant (p=0.31).

**ICU length of stay:** When the 11 studies that reported ICU length of stay as a mean  $\pm$  standard deviation were aggregated, antioxidant supplementation had no effect on ICU length of stay (WMD 0.16, 95% CI -1.38, 1.69, p=0.84, heterogeneity I<sup>2</sup>=21%; figure 5). The following subgroup analysis was completed:

**Antioxidant delivery method:** The result was the same for each of the 3 subgroups: six studies which delivered antioxidants intravenously (WMD -0.20, 95% CI -3.47, 3.07, p=0.90, heterogeneity I<sup>2</sup>=30%; figure 5), two studies which delivered antioxidants via enteral nutrition (WMD -2.65, 95% CI -11.60, 6.31, p=0.56; figure 5), and three studies which delivered antioxidants enterally and intravenously (WMD 0.35, 95% CI -0.97, 1.67, p=0.60, heterogeneity I<sup>2</sup>=0%; figure 5). The test for subgroup differences was not significant (p=0.78).

**Hospital length of stay:** When the 8 studies that reported hospital length of stay as a mean  $\pm$  standard deviation were aggregated, antioxidant supplementation had no effect on hospital length of stay (WMD -0.45, 95% CI -3.53, 2.64, p=0.78, heterogeneity I<sup>2</sup>=0%; figure 6). The following subgroup analysis was completed:

Antioxidant delivery method: The result was the same for each of the 3 of the subgroups: two studies which delivered antioxidants intravenously (WMD -9.38, 95% CI -30.29, 11.52, p=0.38, heterogeneity I<sup>2</sup>=0%; figure 6), two studies which delivered antioxidants via enteral nutrition (WMD 1.22, 95% CI -4.23, 6.67, p=0.66; figure 6), and 3 studies in which antioxidants were delivered enterally and

Critical Care Nutrition: Systematic Reviews March 2021

parenterally (WMD -1.40, 95% CI -6.89, 4.09, p=0.62, heterogeneity I<sup>2</sup>=38%; figure 6). The test for subgroup differences was not significant (p=0.59).

**Duration of mechanical ventilation:** When the 8 studies that reported duration of ventilation as a mean  $\pm$  standard deviation were aggregated, antioxidant supplementation was associated with a significant reduction in duration of ventilation (WMD -2.27, 95% CI -4.46, -0.09, p=0.04, heterogeneity I<sup>2</sup>=72%; figure 7). The following subgroup analysis was completed:

**Antioxidant delivery method:** In the subgroup of 5 studies in which antioxidants were delivered intravenously, antioxidant supplementation was associated with a trend towards a reduction in duration of ventilation (WMD -3.18, 95% CI -7.28, 0.93, p=0.13, heterogeneity I<sup>2</sup>=78%; figure 7). In the 2 studies where antioxidants were delivered via enteral nutrition, antioxidant supplementation was associated with a significant reduction in duration of ventilation (WMD -2.59, 95% CI -4.15, -1.04, p=0.001, heterogeneity I<sup>2</sup>=3%; figure 7). In the subgroup consisting of 1 study in which antioxidants were delivered enterally and intravenously, no effect was observed (WMD 0.40, 95% CI -1.91, 2.71, p=0.73; figure 7). There was a trend towards a difference between the subgroups (p=0.09).

**Quality of Life (QOL) Outcomes:** Berger 2008 and Andrews 2011 reported on QOL outcomes. Berger 2008 conducted the SF-36 questionnaire at 3 months and found a trend towards improved physical activity score in the antioxidant group. There was no difference between the groups for physical limitation, physical pain and perceived health scores. Andrews 2011 completed the SF-12 physical and mental composite scale score and the EQ-5D instrument at 3 and 6 months with survivors and found no significant different between scores.

#### **Conclusions:**

- 1) Antioxidant nutrients are associated with a reduction in overall mortality in critically ill patients.
- 2) Antioxidant nutrients may be associated with a reduction in overall infectious complications in critically ill patients.
- 3) Antioxidant nutrients have no effect on ICU length of stay in critically ill patients.
- 4) Antioxidant nutrients have no effect on hospital length of stay in critically ill patients.
- 5) Antioxidant nutrients are associated with a reduction in duration of ventilation in critically ill patients.
- 6) Antioxidant nutrients are not associated with improvements in QOL in critically ill patients.

Level 1 study: if all of the following are fulfilled: concealed randomization, blinded outcome adjudication and an intention to treat analysis. Level 2 study: If any one of the above characteristics are unfulfilled.

Study	Population	Methods Score	Intervention
Studies in which antioxi	dants were delivered via PN		
1) Kuklinski 1991	Patients with acute pancreatic necrosis N=17	C. Random: not sure ITT: no Blinding: no (4)	PN + selenium supplementation (500 $\mu g$ /d) vs. PN without selenium supplementation
2) Young 1996	Severely head injured patients, ventilated N=68	C. Random: yes ITT: yes Blinding: double (7)	12 mg elemental zinc via PN, then progressing to oral zinc from 0- 15 days vs. 2.5 mg elemental zinc, then progressing to oral placebo
3) Zimmerman 1997	Patients with SIRS, APACHE > 15 and multiorgan failure score >6 N=40	C. Random: no ITT: yes Blinding: no (6)	1000 μg Na-Selenite as a bolus IV then 1000μg Na-Selenite/24 hrs as a continuous infusion over 28 days vs. standard
4) Berger 1998	Burns > 30 % TBSA N=20	C. Random: yes ITT: yes Blinding: double blind (12)	IV Copper (40.4 μmol), selenium (159 μg), zinc (406 μmol) + standard trace elements vs. standard trace elements (Copper 20 μmol, selenium 32 μg, zinc 100 μmol) from day 0- 8, all received early EN
5) Angstwurm 1999	Patients with systematic inflammatory response syndrome from 11 ICUs N=42	C. Random: not sure ITT: yes Blinding: no (10)	PN with high dose selenium (535 $\mu$ g x 3 days, 285 $\mu$ g x 3 days and 155 $\mu$ g x 3 days and 35 $\mu$ g thereafter) vs. low dose selenium (35 $\mu$ g/day for duration of study)
6) Berger 2001	Trauma patients, surgical ICU N=32	C. Random: yes ITT: no Blinding: double blind (9)	IV Selenium supplementation (500 $\mu$ g/day ) vs. placebo (Selenium group randomized further to two groups: 500 $\mu$ g Selenium alone vs. 500 $\mu$ g Selenium + 150 mg $\alpha$ tocopherol + 13 mg zinc) given slowly for 1 <sup>st</sup> 5 days after injury (All groups received EN)
7) Lindner 2004	Patients with acute pancreatitis admitted to the ICU N=70	C. Random: not sure ITT: no Blinding: single (9)	IV sodium selenite dose of 2000 $\mu g$ on day 1, 1000 $\mu g$ on days 2-5, and 300 $\mu g$ from day 6 until discharge vs placebo (isotonic 0.9% IV NaCl solution).

8) Angstwurm 2007	Multicentre mixed ICUs N=249	C.Random: not sure ITT: no Blinding: double (8)	1000µg Selenium IV within 1 hr followed by 1000µg Selenium for 14 days vs. NaCl (0.9%) (all patients received EN or PN)
9) Berger 2007	Bums > 20 % TBSA N=21	C.Random: not sure ITT: yes Blinding: no (8)	IV 100 ml of Copper (59 μmol) + Selenium (375 μgm + zinc (574 μmol) vs. NaCl (0.9%) from admission for 5-15 days. Both groups were on EN.
10) Forceville 2007	Septic shock patients from 7 ICUs N=60	C.Random: not sure ITT: no Blinding: double (8)	4000µg Selenium IV on day 1 followed by 1000µg Selenium for 9 days vs. NaCl (0.9%) (all patients received EN or PN)
11) Mishra 2007	Septic ICU patients N=40	C.Random: not sure ITT: yes Blinding: double (9)	474 μg Selenium IV x 3 days followed by 316 μg x 3 days, 158 μg x 3 days and 31.6 μg thereafter vs. 31.6 μg Selenium (all patients received EN or PN).
12) El-Attar 2009	COPD patients N=80	C.Random: yes ITT: yes Blinding: yes (12)	IV selenium as sodium selenite 100 $\mu$ g/day, zinc 2 mg/day and manganese 0.4 mg/day vs. none. TE were administered during the period on mechanical ventilation
13) González 2009	Medical/surgical ICU pts N=68	C.Random: yes ITT: yes Blinding: double (7)	day 1 sodium selenite 1000 $\mu g$ , day 2 sodium selenite 500 $\mu g$ and thereafter 200 $\mu g$ during seven additional days vs selenite 100 $\mu g/d$
14) Andrews 2011	Mixed ICU N=502	C. Random: yes ITT: yes Blinding: double (13)	500μg selenium supplemented PN (12.5g nitrogen, 2000kcal) vs. standard PN (12.5g nitrogen, 2000kcal) initiated after ICU admission (actual median 2.6 days) for 7 days (actual duration, mean 4.1 days).
15) Manzanares 2011	Septic or trauma patients N=31	C. Random: not sure ITT: no (except mortality) Blinding: single (9)	IV Selenium supplementation loading dose 2000 $\mu g$ (2 hours) on day 1 followed by 1600 $\mu g$ /day for 10 days vs. NaCl as placebo

16) Valenta 2011	Patients with sepsis or SIRS N=150	C. Random: not sure ITT: yes Blinding: no (8)	IV Selenium supplementation loading dose 1000 μg on day 1 followed by 500μg/day for 5-14 days + <75μg/day of Na-selenite added to PN. vs. NaCl + <75μg/day of Na-selenite added to PN.
17) Woth 2014	Mixed ICU, severe septic pts w multi-organ failure N=40	C. Random: not sure ITT: yes Blinding: no (6)	1000-μg/30 minutes loading dose of Na selenite and 1000-μg/die treatment for a maximum of 14 days vs control group (not described).
18) Bloos, 2016	Multicentre Mixed ICU pts with severe sepsis or septic shock in last 24 hrs. N=1180	C. Random: yes ITT: yes Blinding: double (12)	IV loading dose of 1000 µg sodium selenite followed by continuous IV of 1000 µg sodium selenite daily until ICU discharge or for 21 days, whichever comes first vs placebo (0.9% sodium chloride).
Studies in which antioxid	ants were delivered via EN		
19) Maderazo 1991	Blunt Trauma N=46	C. Random: yes ITT: yes Blinding: double (7)	200 mg Ascorbic acid, then $\uparrow$ 500 mg + 50 mg $\alpha$ tocopherol in 100 ml of D5W vs. 100 ml of D5W (Experimental group divided into 2 groups, 200 mg ascorbic acid vs. 50 mg $\alpha$ tocopherol). Given as 2 hr infusions from Day 0-7. (All groups received enteral nutrition or po intake)
20) Preiser 2000	Mixed ICU N=51	C. Random: not sure ITT: no Blinding: single (7)	Antioxidant rich formula via EN (133 μg /100 ml vit. A, 13 mg/100 ml Vit C & 4.9 mg/100 ml Vit E) vs. isonitrogenous, isocaloric standard formula (67 μg /100 ml vit. A, 5 mg/100 ml Vit C and 0.81 mg/100 ml Vit E) from Day 0- 7
21) Nathens 2002	General Surgical/Trauma ICU N=770	C.Random: not sure ITT: no Blinding: no (7)	$\alpha$ tocopherol $$ 1000 IU q 8 h via naso or orogastric tube and ascorbic acid 1000 mg q 8 h via IV vs. standard care
22) Crimi 2004	Mixed ICU N=224	C.Random: not sure ITT: no Blinding: no (7)	Vit C (500 mg), Vit E (400 IU) within 72 hrs for 10 days vs. isotonic saline (all groups received EN)
23) Schneider 2011	ICU patients with sepsis or SIRS N=58	C.Random: not sure ITT: yes Blinding: single blind (8)	Fresenius Kabi Intestamin (300µg selenium, zinc 20mg, vitamin C 1500mg, Vitamin E 500mg) vs. Fresubin original plus 250mL water delivered via duodenal tube and initiated within first 48h of ICU admission. Both groups received Fresenius Kabi original fiber and supplemental PN if <60% adequacy

24) Nogueira 2013	ICU pts requiring EN (80% post- op, 20% medical) N=70	C.Random: not sure ITT: no Blinding: no (4)	'Hospital routine' EN + 10 000 IU retinol acetate, 400 mg vit E, 600 mg vit C vs 'hospital routine' EN. Note: 'hospital routine' not defined in article.							
25) Howe 2015	Mechanically ventilated ICU patients N=72	C.Random: not sure ITT: no Blinding: no (4)	Vit C (1000mg) + Vit E (1000 IU) + N-acetylcysteine (400 mg) q8h as a bolus via EN vs Vit C (1000m Vit E (1000 IU) q8h as a bolus via EN vs placebo q8h as a bolus via EN. Note: 2 intervention groups							
Studies in which antioxidants were delivered simultaneously via PN and EN										
26) Porter 1999	Surgical ICU Penetrating trauma patients with injury severity score ≥25 N=18	C. Random: yes ITT: yes Blinding: no (9)	50 $\mu g$ selenium IV q 6 hrs + 400 IU Vit E, 100 mg Vit. C q 8 hrs and 8 g of N-acetylcysteine (NAC) q 6 hrs via nasogastric or oral route, from Day 0-7 vs. none							
27) Berger 2008	Mixed ICU N=200	C.Random: not sure ITT: yes Blinding: no (10)	IV Selenium supplementation loading dose 540 μg/day + zinc (60 mg) + Vit C 2700 mg + Vit B 305 mg + Vit E enteral 600 mg + Vit E 12.8 mg IV for 2 days followed by half the dose of all vs. standard vitamins. (All groups received EN or PN)							
28) Heyland 2013	Multicentre mixed ICUs N=1218	C.Random: yes ITT: yes Blinding: double (12)	500 $\mu g$ selenium via PN + 300 $\mu g$ selenium, 20 mg zinc, 10 mg beta carotene, 500 mg vitamin E, 1500 mg vitamin C via EN vs. placebo via PN and EN
